

A 60.0 kg jumper jumps from a bridge 50.0m above the water. If the bungee cord is 15.0m

a) What is her gravitational potential energy on the bridge?

$$E_g = mgh \text{ Near Earth}$$

$$E_g = 60 \times 9.81 \times 50 = 29\,430 \text{ J relative to the water}$$

b) What is her kinetic energy when she has fallen 15.0m? (before the cord starts stretching)

$$60 \times 9.81 \times 15 = 8,829 \text{ J}$$

E_g is transformed into E_k

$$v^2 = u^2 + 2as$$

$$E_k = \frac{1}{2}mv^2 = \frac{1}{2}m(2as) = mas \text{ same thing}$$

$$a=g \quad s=\Delta h$$

c) what is the spring constant of the cord(k) if she stops just as her head hits the water?

$$W = \Delta \text{Energy}$$

the energy transforms from E_g to E_k to E_{elastic}

$$E_g = E_{\text{elastic}}$$

$$mgh = \frac{1}{2}kx^2$$

$$k = \frac{2 \times 60 \times 9.81 \times 50}{(50-15)^2} = 48.049 \text{ N/m} \approx \boxed{48 \frac{\text{N}}{\text{m}}}$$

d) what is her acceleration at the lowest point?

$$F=ma = \sum F = F_{up}-F_{down} = F_{elastic} - F_g$$

$$ma = kx-mg$$

$$60\text{kg} \times a = 48.049\text{N/m} (35\text{m}) - 60\text{kg} \times 9.81\text{N/kg}$$

$$a = ((48 \times 35) - (60 \times 9.81)) / 60 = 18.19 \text{ m/s}^2 \text{ up}$$

e) where is her acceleration = 0?

$$F_{net} = 0 \quad \text{so} \quad F_{up} = F_{down}$$

$$K(x) = mg$$

$$x = \frac{60(9.8)}{48.049 \frac{\text{N}}{\text{m}}}$$

$$x = \boxed{12.25 \text{ m}}$$

a) sketch her s-t graph assuming the spring energy dissipates over 3 bounces.

$$T = 2\pi \sqrt{\frac{m}{k}} = 2\pi \sqrt{\frac{60}{48}}$$

$$2 \times 3.14159 \times \sqrt{60/48} = 7.024808797433565 \text{ s}$$

$$d = \frac{1}{2}at^2$$

$$t = \sqrt{\frac{2 \times 15}{9.8}} = 1.75 \text{ s}$$

$$\tan \theta = \frac{g(T)^2}{4\pi^2 r}$$

$$mg + \frac{mv^2}{r}$$

$$65 \times 9.8 + \frac{65(210)^2}{700}$$

$$65 \times 9.8 + (65 \times 210 \times 210 / 700) =$$

$$4,732$$
